News (15 November 2007)

It has been a few months since we started and everything is starting to run pretty well. Topographic and hydrodynamic data measured in Jimmy's Beach and Shoal Bay are looking good and Lara Ainley has submitted her honours thesis.

- DECC has undertaken detailed bathymetric measurements that are being postprocessed and will soon be available to start setting the models up and planning exact locations for ADCP deployments. We will also be able of comparing the present flood-tide delta with previous bathymetries.
- We are currently finalising the planning of what would be our first ADCP fieldwork campaign that will take place in the end of the month. Plans are to undertake lagrangian measurements during a entire tidal cycle. We will also do our first ADCP deployments- during the following months, we will deploy our ADCPs in different locations along the estuary, each time for three to four weeks.
